

Video Surveillance

Zaptronix Video Surveillance systems draw on the most advanced digital video and audio monitoring, recording and communications technology available today. As one of the early pioneering companies in digital systems, our in-depth expertise in digital video system integration stems from our proprietary in-house development work and hundreds of successful installations performed over the past 15 years. Video data management forms the foundation element of our Integrated Systems Management Interface that allows us to build versatile, networked systems with a powerful command and control centre located on or off the client's site. Zaptronix offers various digital recording technologies to suit the application requirements independent of camera type, including integrated and video-over-IP architectures.

The versatility and configurability of Zaptronix surveillance systems allows us to craft solutions for simple requirements with a few cameras through to large campuses requiring thousands of cameras and enterprises with multiple networked sites. In the case of larger sites our Systems Management Interface provides complete site resource management with interactive site map graphics, allowing selection of and instant access to cameras' views, microphones, door status and much more. Centralised alarm management can be achieved from the client's console or by taking advantage of Zaptronix Central Monitoring service. This facility is a fully-fledged alarm management system with a capability for multiple operators servicing alarms according to priority, report escalation and operator audit trails.
